# Mixed Linear Complementarity Problem Problems 

Chris Hecker 〈checker@d6.com〉

May 27, 2001

## 1 Introduction

This is a little note showing a problem with solving linear programs (LPs) with no nonnegativity constraints by converting them to mixed linear complementarity problems (MLCPs) and running the MLCP through Lemke's Algorithm.

## 2 LP $\rightarrow$ MLCP Conversion

Here's the LP we're working with:

$$
\begin{gather*}
\min c^{T} x  \tag{1}\\
A x \geq b
\end{gather*} \quad \text { where } \quad A=\left(\begin{array}{rr}
1 & 5 \\
5 & -1 \\
-1 & -1
\end{array}\right), \quad b=\left(\begin{array}{c}
-15 \\
-11 \\
4
\end{array}\right), \quad c=\binom{1}{10}
$$

Note that there is no $x \geq 0$ constraint, and in fact, the solution has both components of $x$ negative.

The solution to this $\mathrm{LP}^{1}$ is

$$
x=\binom{-5 / 4}{-11 / 4} .
$$

To convert this LP into a MLCP, we use the KKT optimality conditions

$$
\begin{aligned}
u=c-A^{T} y & =0 \\
v=A x-b & \geq 0 \\
(v, y) & \geq 0 \\
\text { and } v^{T} y & =0 .
\end{aligned}
$$

They give us the MLCP

$$
\binom{u}{v}=\left(\begin{array}{cc}
0 & -A^{T}  \tag{2}\\
A & 0
\end{array}\right)\binom{x}{y}+\binom{c}{-b},(v, y) \geq 0, u=0, \text { and } x \text { free. }
$$

[^0]
## 3 Lemke's Algorithm

The inital tableau for Lemke's Algorithm for the MLCP (2) is

|  | 1 | $z_{0}$ | $x_{1}$ | $x_{2}$ | $y_{1}$ | $y_{2}$ | $y_{3}$ |
| ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| $u_{1}$ | 1 | $-\frac{1}{4}$ | 0 | 0 | -1 | -5 | 1 |
| $u_{2}$ | 10 | $-\frac{5}{2}$ | 0 | 0 | -5 | 1 | 1 |
| $v_{1}$ | 15 | 1 | 1 | 5 | 0 | 0 | 0 |
| $v_{2}$ | 11 | 1 | 5 | -1 | 0 | 0 | 0 |
| $v_{3}$ | -4 | 1 | -1 | -1 | 0 | 0 | 0 |

The components of covering vector for the artificial variable ( $z_{0}$ ) that correspond to the nonnegativity-constrained basic variables ( $v_{1}, v_{2}$, and $v_{3}$ ) are 1 , as usual. In this tableau, $z_{0}$ will be driven to 4 to create an initial feasible solution by driving $v_{3}$ to 0 . I've chosen the $u$ components of the covering vector to bring $u_{1}$ and $u_{2}$ to 0 during this drive, as they should be for a feasible solution. I just made this up, and I have no idea if it's the right thing to do, so this may part of the problem I outline below.

Regardless, our first pivot is $\left\langle v_{3}, z_{0}\right\rangle$.

|  | 1 | $v_{3}$ | $x_{1}$ | $x_{2}$ | $y_{1}$ | $y_{2}$ | $y_{3}$ |
| :--- | :---: | ---: | ---: | ---: | ---: | ---: | ---: |
| $u_{1}$ | 0 | $-\frac{1}{4}$ | $-\frac{1}{4}$ | $-\frac{1}{4}$ | -1 | -5 | 1 |
| $u_{2}$ | 0 | $-\frac{5}{2}$ | $-\frac{5}{2}$ | $-\frac{5}{2}$ | -5 | 1 | 1 |
| $v_{1}$ | 19 | 1 | 2 | 6 | 0 | 0 | 0 |
| $v_{2}$ | 15 | 1 | 6 | 0 | 0 | 0 | 0 |
| $z_{0}$ | 4 | 1 | 1 | 1 | 0 | 0 | 0 |

The complement of $v_{3}$ is $y_{3}$, and we're left with a quandry. Driving $y_{3}$ will not increase any of the nonnegative variables because their tableau entries are 0. Driving $y_{3}$ will cause the $u$ variables to become non- 0 , however, so we need to pivot one of them into the nonbasic set. But which one? Note that we've numbered this tableau (3) and we'll refer to it later.

Let's pick $u_{2}$, for reasons that will become obvious. So, we pivot $\left\langle u_{2}, y_{3}\right\rangle$.

|  | 1 | $v_{3}$ | $x_{1}$ | $x_{2}$ | $y_{1}$ | $y_{2}$ | $u_{2}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $u_{1}$ | 0 | $\frac{9}{4}$ | $\frac{9}{4}$ | $\frac{9}{4}$ | 4 | -6 | 1 |
| $y_{3}$ | 0 | $\frac{5}{2}$ | $\frac{5}{2}$ | $\frac{5}{2}$ | 5 | -1 | 1 |
| $v_{1}$ | 19 | 1 | 2 | 6 | 0 | 0 | 0 |
| $v_{2}$ | 15 | 1 | 6 | 0 | 0 | 0 | 0 |
| $z_{0}$ | 4 | 1 | 1 | 1 | 0 | 0 | 0 |

The next complement is $x_{2}$. The only option for pivoting is $u_{1}$, since driving $x_{2}$ will make it non- 0 . So, we pivot $\left\langle u_{1}, x_{2}\right\rangle$.

|  | 1 | $v_{3}$ | $x_{1}$ | $u_{1}$ | $y_{1}$ | $y_{2}$ | $u_{2}$ |
| ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| $x_{2}$ | 0 | -1 | -1 | $\frac{4}{9}$ | $-\frac{16}{9}$ | $\frac{8}{3}$ | $-\frac{4}{9}$ |
| $y_{3}$ | 0 | 0 | 0 | $\frac{10}{9}$ | $\frac{5}{9}$ | $\frac{17}{3}$ | $-\frac{1}{9}$ |
| $v_{1}$ | 19 | -5 | -4 | $\frac{8}{3}$ | $-\frac{32}{3}$ | 16 | $-\frac{8}{3}$ |
| $v_{2}$ | 15 | 1 | 6 | 0 | 0 | 0 | 0 |
| $z_{0}$ | 4 | 0 | 0 | $\frac{4}{9}$ | $-\frac{16}{9}$ | $\frac{8}{3}$ | $-\frac{4}{9}$ |

$x_{1}$ is now our driving variable. The blocking variable is $v_{1}\left(x_{2}\right.$ is free so it can't block us), so we pivot $\left\langle v_{1}, x_{1}\right\rangle$.

|  | 1 | $v_{3}$ | $v_{1}$ | $u_{1}$ | $y_{1}$ | $y_{2}$ | $u_{2}$ |
| ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| $x_{2}$ | $-\frac{19}{4}$ | $\frac{1}{4}$ | $\frac{1}{4}$ | $-\frac{2}{9}$ | $\frac{8}{9}$ | $-\frac{4}{3}$ | $\frac{2}{9}$ |
| $y_{3}$ | 0 | 0 | 0 | $\frac{10}{9}$ | $\frac{5}{9}$ | $\frac{17}{3}$ | $-\frac{1}{9}$ |
| $x_{1}$ | $\frac{19}{4}$ | $-\frac{5}{4}$ | $-\frac{1}{4}$ | $\frac{2}{3}$ | $-\frac{8}{3}$ | 4 | $-\frac{2}{3}$ |
| $v_{2}$ | $\frac{87}{2}$ | $-\frac{13}{2}$ | $-\frac{3}{2}$ | 4 | -16 | 24 | -4 |
| $z_{0}$ | 4 | 0 | 0 | $\frac{4}{9}$ | $-\frac{16}{9}$ | $\frac{8}{3}$ | $-\frac{4}{9}$ |

Now we're driving $y_{1}$, and we do a minimum ratio test between $z_{0}$ and $v_{2}$, and the winner is $z_{0}\left(\min \left\{\frac{4}{16 / 9}, \frac{87 / 2}{16}\right\}=\frac{4}{16 / 9}=9 / 4\right)$. So, we pivot $\left\langle z_{0}, y_{1}\right\rangle$.

|  | 1 | $v_{3}$ | $v_{1}$ | $u_{1}$ | $z_{0}$ | $y_{2}$ | $u_{2}$ |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| $x_{2}$ | $-\frac{11}{4}$ | $\frac{1}{4}$ | $\frac{1}{4}$ | 0 | $-\frac{1}{2}$ | 0 | 0 |
| $y_{3}$ | $\frac{5}{4}$ | 0 | 0 | $\frac{5}{4}$ | $-\frac{5}{16}$ | $\frac{13}{2}$ | $-\frac{1}{4}$ |
| $x_{1}$ | $-\frac{5}{4}$ | $-\frac{5}{4}$ | $-\frac{1}{4}$ | 0 | $\frac{3}{2}$ | 0 | 0 |
| $v_{2}$ | $\frac{15}{2}$ | $-\frac{13}{2}$ | $-\frac{3}{2}$ | 0 | 9 | 0 | 0 |
| $y_{1}$ | $\frac{9}{4}$ | 0 | 0 | $\frac{1}{4}$ | $-\frac{9}{16}$ | $\frac{3}{2}$ | $-\frac{1}{4}$ |

Since we just pivoted $z_{0}$ into the nonbasic set, we're done. We pick out the solution $x_{1}=-5 / 4, x_{2}=-11 / 4$ as expected (or hoped). It worked!

But wait!

## 4 Choosing a Different Path

Back in tableau (3), we made the arbitrary choice to pivot $\left\langle u_{2}, y_{3}\right\rangle$ instead of $\left\langle u_{1}, y_{3}\right\rangle$. As far as I can tell from looking at the tableau or the history up to that point, there's no reason to pick one or the other. Here's the tableau again for convenience:

|  | 1 | $v_{3}$ | $x_{1}$ | $x_{2}$ | $y_{1}$ | $y_{2}$ | $y_{3}$ |
| :--- | :---: | ---: | ---: | ---: | ---: | ---: | :---: |
| $u_{1}$ | 0 | $-\frac{1}{4}$ | $-\frac{1}{4}$ | $-\frac{1}{4}$ | -1 | -5 | 1 |
| $u_{2}$ | 0 | $-\frac{5}{2}$ | $-\frac{5}{2}$ | $-\frac{5}{2}$ | -5 | 1 | 1 |
| $v_{1}$ | 19 | 1 | 2 | 6 | 0 | 0 | 0 |
| $v_{2}$ | 15 | 1 | 6 | 0 | 0 | 0 | 0 |
| $z_{0}$ | 4 | 1 | 1 | 1 | 0 | 0 | 0 |

Let's look at what happens when we pivot $\left\langle u_{1}, y_{3}\right\rangle$ instead.

|  | 1 | $v_{3}$ | $x_{1}$ | $x_{2}$ | $y_{1}$ | $y_{2}$ | $u_{1}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $y_{3}$ | 0 | $\frac{1}{4}$ | $\frac{1}{4}$ | $\frac{1}{4}$ | 1 | 5 | 1 |
| $u_{2}$ | 0 | $-\frac{9}{4}$ | $-\frac{9}{4}$ | $-\frac{9}{4}$ | -4 | 6 | 1 |
| $v_{1}$ | 19 | 1 | 2 | 6 | 0 | 0 | 0 |
| $v_{2}$ | 15 | 1 | 6 | 0 | 0 | 0 | 0 |
| $z_{0}$ | 4 | 1 | 1 | 1 | 0 | 0 | 0 |

Now the driving complement of $u_{1}$ is $x_{1}$, so we must pivot $\left\langle u_{2}, x_{1}\right\rangle$ to keep $u_{2}$ from becoming non- 0 .

|  | 1 | $v_{3}$ | $u_{2}$ | $x_{2}$ | $y_{1}$ | $y_{2}$ | $u_{1}$ |
| ---: | :---: | ---: | ---: | ---: | ---: | ---: | ---: |
| $y_{3}$ | 0 | 0 | $-\frac{1}{9}$ | 0 | $\frac{5}{9}$ | $\frac{17}{3}$ | $\frac{10}{9}$ |
| $x_{1}$ | 0 | -1 | $-\frac{4}{9}$ | -1 | $-\frac{16}{9}$ | $\frac{8}{3}$ | $\frac{4}{9}$ |
| $v_{1}$ | 19 | -1 | $-\frac{8}{9}$ | 4 | $-\frac{32}{9}$ | $\frac{16}{3}$ | $\frac{8}{9}$ |
| $v_{2}$ | 15 | -5 | $-\frac{8}{3}$ | -6 | $-\frac{32}{3}$ | 16 | $\frac{8}{3}$ |
| $z_{0}$ | 4 | 0 | $-\frac{4}{9}$ | 0 | $-\frac{16}{9}$ | $\frac{8}{3}$ | $\frac{4}{9}$ |

The next complement is $x_{2}$, and $v_{2}$ is the blocking variable. So, we pivot $\left\langle v_{2}, x_{2}\right\rangle$.

|  | 1 | $v_{3}$ | $u_{2}$ | $v_{2}$ | $y_{1}$ | $y_{2}$ | $u_{1}$ |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| $y_{3}$ | 0 | 0 | $-\frac{1}{9}$ | 0 | $\frac{5}{9}$ | $\frac{17}{3}$ | $\frac{10}{9}$ |
| $x_{1}$ | $-\frac{5}{2}$ | $-\frac{1}{6}$ | 0 | $\frac{1}{6}$ | 0 | 0 | 0 |
| $v_{1}$ | 29 | $-\frac{13}{3}$ | $-\frac{8}{3}$ | $-\frac{2}{3}$ | $-\frac{32}{3}$ | 16 | $\frac{8}{3}$ |
| $x_{2}$ | $\frac{5}{2}$ | $-\frac{5}{6}$ | $-\frac{4}{9}$ | $-\frac{1}{6}$ | $-\frac{16}{9}$ | $\frac{8}{3}$ | $\frac{4}{9}$ |
| $z_{0}$ | 4 | 0 | $-\frac{4}{9}$ | 0 | $-\frac{16}{9}$ | $\frac{8}{3}$ | $\frac{4}{9}$ |

Finally, our driving variable is now $y_{2}$, the complement of $v_{2}$. However, $y_{2}$ is unblocked by all basic variables, so we have a secondary ray termination!

## 5 Questions

1. Was the inital assumption to use $z_{0}$ to drive $u_{1}$ and $u_{2}$ to 0 the correct one?
2. If so, what went wrong here? Was there a good reason to choose the $u_{2}$ pivot in (3), which led to the correct answer, over the $u_{1}$ pivot, which led to a secondary ray termination?
3. Is this even remotely the way to solve MLCPs? I haven't been able to find a single paper or reference about the actual implementation of a modified Lemke solver for MLCPs, even though everyone says it's trivial.
4. Did I make some stupid mistake and I'm missing something obvious?

[^0]:    ${ }^{1}$ Incidentally, this LP was generated by moving the nonnegative LP with $b=\left(\begin{array}{ll}3 & 1\end{array}-2\right)^{T}$ (which is the original LP I sent mail about on 5/24/2001) into the third quadrant by translating $x$ by $(-3-3)^{T}$.
